III Man-Machine Collaboration on a Shop Floor

Industrial human augmentation systems

Curriculum Development
of Master's Degree Program in

Industrial Engineering for Thailand Sustainable Smart Industry

Industrial human augmentation systems

- Advanced human augmentation provides a human-centred perspective on technology design.
- It builds upon earlier technological concepts such as
 - ubiquitous computing
 - wearable computing
 - augmented- virtual- and mixed realities
 - autonomous systems
 - ambient intelligence

Industrial human augmentation systems

- New advanced human augmentation solutions will strongly influence industrial work tasks.
- Many industrial jobs are anticipated to become knowledge-intensive and even new work roles are expected to emerge.
- Future workers will monitor and supervise autonomous systems
 - the employees possess multifunctional skills
 - take more responsibility in the content of their work
 - work tasks are shared flexibly between automation systems and the human workers

Industrial human augmentation systems

- The vision of the future Augmented Superworker
 - the employee's wearable enhancements will shift from safety and security towards connectivity, comfort and efficient co-operation with intelligent automation.
 - Future industrial work is expected to move towards a shared awareness with autonomous systems
 - The content of the work moves from distributing the workload and observing the workers towards co-evolving a human-autonomous system partnership.
 - The future employees will need to trust their systems; they need to experience control over their tools and ownership of their work processes, and, primarily they require advanced and efficient tools for working in their new operational environments.

Industrial human augmentation systems

- The future employees
 - need to trust their systems
 - need to experience control over their tools and ownership of their work processes
 - require advanced and efficient tools for working in their new operational environments

of the European Union

Industrial human augmentation systems

- The technical interaction concepts are based on
 - virtual, augmented and mixed reality (VR/AR/MR) solutions
 - wearable computing devices
 - smart materials
 - brain and skin interfaces and near-eye displays
- The information provision for the augmented human utilizes
 - activity and behavior analysis
 - personalization, situation and context awareness

Industrial human augmentation systems

- Industrial cases of augmented human; telecommunication satellites
 - A thousand coax cables must be mounted on the payload's panels during the assembly phase.
 - The length of the cables ranges from 20 cm to 4 m.
 - The installation of a single coax lasts approximately 1 hour included
 - preparation of the installation
 - the assembly
 - the documentary aspects related to traceability

Industrial human augmentation systems

- Augmented on-job-learning in a Mixed reality environment
- The job description for the actual test task was as follows:
“You are a maintenance engineer and have this system in use. Now you need to check the status of the engine and perform the necessary procedures. The system tells you how to proceed.”

Industrial human augmentation systems

- Augmented human suggested that the focus of design investigations should be very close to the human boundary level; to human experiences.
- The premise for the design investigations should start by
 - Considering the path from the present to future
 - Prioritizing key focus areas such as high knowledge manual work, e.g. knowledge-intensive maintenance and emerging Augmented Human technologies
